NAVIGATION METHOD AND APPARATUS FOR LEARNING
AND UPDATING POSITION OF STREET ADDRESS

Abstract of the Disclosure

5   A navigation method and apparatus is capable of learning and updating a street address thereby more precisely matching a position of destination with a street address of the destination based on a difference between the actual arrival position and the calculated position of the destination. The

10 navigation method includes the steps of: producing an assumed position of a destination based on an address number on a street indicating an address of the destination; detecting an arrival at an actual position of the destination; examining a difference between the assumed position of the

15 destination and the actual position of the destination; and updating address data using the difference so as to match the street address number of the destination with the actual position of the destination.
